FINAL EXAM: Linear Systems

Monday May 14, 2007: 8:30-11:30am

Math 214

Name: _____

Prof. R. Buckmire

Directions: Read *all* problems first before answering any of them. There are EIGHT (8) problems. They are NOT related. The first four problems involve proofs and are more theoretical, the last four problems are more calculation oriented.

This exam is a closed-notes, closed-book, test. No calculators.

You must include ALL relevant work to support your answers. Use complete English sentences where possible and CLEARLY indicate your final answer from your "scratch work."

Pledge: I, _____, pledge my honor as a human being and Occidental student, that I have followed all the rules above to the letter and in spirit.

TOTAL		200

1. [25 points total.] TRUE or FALSE. TRUE or FALSE – put your answer in the box. To receive ANY credit, you must also give a brief, and correct, explanation in support of your answer! Remember if you think a statement is TRUE you must prove it is ALWAYS true. If you think a statement is FALSE then all you have to do is show there exists a counterexample which proves the statement is FALSE.

(a) If \vec{x} and \vec{y} are orthogonal, then they are linearly independent.

(b) The row space of an $m \times n$ matrix A is a subspace of \mathbb{R}^m .

(c) If A is a symmetric matrix then $A + \mathcal{I}$ is also a symmetric matrix.

(d) $\operatorname{proj}_{\vec{u}}(\vec{v} - \operatorname{proj}_{\vec{u}}(\vec{v})) = \vec{0}$, where $\operatorname{proj}_{\vec{u}}(\vec{v}) = \left(\frac{\vec{v} \cdot \vec{u}}{\vec{u} \cdot \vec{u}}\right) \vec{u}$. (Draw a picture!) $[\operatorname{proj}_{\vec{u}}(\vec{v}) \text{ is the projection of } \vec{v} \text{ in the direction } \vec{u}]$

(e) The set of solution vectors to the linear system $A\vec{x} = \vec{b}$ is a vector space.

2. [25 points total.] Linear Systems, Column Space. Solvability.

a. (15 points). Prove the statement(s) "The linear system $A\vec{x} = \vec{b}$ has no solution IF AND ONLY IF \vec{b} is not in the column space of the $m \times n$ matrix A."

b. (10 points). Provide an example of a linear system $A\vec{x} = \vec{b}$ and the column space of A and also show that $\vec{b} \notin col(A)$ and your given linear system $A\vec{x} = \vec{b}$ has no solutions.

3. [25 points total.] Linear Independence.

a. (10 points). If a matrix has more rows than columns, then its columns must be linearly dependent. Prove this statement is either TRUE or FALSE.

b. (10 points). If a matrix has more columns than rows, then its columns must be linearly dependent. Prove this statement is either TRUE or FALSE.

c. (5 points). Write down an example of a matrix which has more rows than columns and another matrix that has more columns than rows which go along with your answers in part (a) and (b)

4. [25 points total.] Vector Spaces.

a. (15 points). Prove that the left nullspace, null(A^T), i.e. the set of solution vectors to $A^T \vec{x} = \vec{0}$ (or $\vec{x}^T A = \vec{0}$), is a subspace. [HINT: Use the definition of subspace.]

b. (10 points). Find the left null space of $\begin{bmatrix} 1 & 5 \\ 3 & 2 \\ 4 & 7 \end{bmatrix}$. What vector space is the left nullspace a subspace of? What vector space is it orthogonal to?

5. [25 points total.] **Determinants, Block Matrices.** Consider the 4×4 matrix

$$M = \begin{bmatrix} 0 & a & b & d \\ -a & a & c & e \\ -b & -c & 0 & 0 \\ -d & -e & 0 & 0 \end{bmatrix}$$

(a) (10 points.) Think of $M = \begin{bmatrix} A & B \\ C & D \end{bmatrix}$ as a block matrix consisting of four 2 × 2 matrices A, B, C and D. Find the determinant of each of the matrices A, B, C and D.

(b) (10 points.) Show that the determinant of $M = (be - dc)^2$ using the Laplace Expansion Formula (pick the row or column you expand about carefully!)

(c) (5 points.) Write down a relationship between the determinant of the block matrix M, i.e. det(M) and the determinant of each of the blocks, i.e. det(A), det(B), det(C), and det(D).

6. [25 points total.] Eigenvalues, Eigenvectors, Diagonalization.

Let A be an unknown 2×2 matrix with eigenvalues $\lambda_1 = 5$ and $\lambda_2 = -1$ corresponding to eigenvectors $\vec{v}_1 = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$ and $\vec{v}_2 = \begin{bmatrix} 2 \\ -1 \end{bmatrix}$ respectively.

a. (6 points). Compute the determinant and trace of the unknown matrix A from the information you currently have.

b. (10 points). Given that A is similar to a diagonal matrix Λ such that $AS = S\Lambda$, compute A.

c. (9 points). Confirm your answers to part (a) and verify that the \vec{v}_1 and \vec{v}_2 are indeed eigenvectors of A with corresponding eigenvalues λ_1 and λ_2 . [HINT: you do not have to find eigenvalues and eigenvectors from scratch!]

7. [25 points total.] Projections, Orthogonal Complements, Analytic Geometry, Orthogonal Decomposition.

Consider
$$\mathcal{W} = \operatorname{span} \left\{ \begin{bmatrix} 1\\3\\-2 \end{bmatrix}, \begin{bmatrix} 5\\1\\4 \end{bmatrix} \right\}$$
 and $\vec{v} = \begin{bmatrix} 1\\3\\5 \end{bmatrix}$
a. (6 points). Show that \mathcal{W} is the plane $-x + y + z = 0$.

b. (6 points). Find an orthogonal basis for \mathcal{W} .

c. (6 points). Find the projection of \vec{v} onto \mathcal{W}^{\perp} .

d. (7 points). Find the orthogonal decomposition of \vec{v} with respect to \mathcal{W} and \mathcal{W}^{\perp} , i.e. $\vec{v} = c_1 \vec{w}_1 + c_2 \vec{w}_2 + c_3 \vec{w}_3$ where $\mathcal{W} = \operatorname{span}(\vec{w}_1, \vec{w}_2)$ and $\mathcal{W}^{\perp} = \operatorname{span}(\vec{w}_3)$.

8. [25 points total.] Solutions of Linear Systems, Invertibility, Singular. Consider the linear system with unknown parameter d

$$1x + 1y + 1z = 1$$

$$1x + (d + 1)y + 3z = 5$$

$$0x + 2y + dz = -4$$

a. (10 points). Show that after applying elementary row operations to the linear system

 $A\vec{x} = \vec{b} \text{ the augmented coefficient matrix becomes} \begin{bmatrix} 1 & 1 & 1 & | & 1 \\ 0 & d & 2 & | & 4 \\ 0 & 0 & d - \frac{4}{d} & | & -4 - \frac{8}{d} \end{bmatrix}$

b. (5 points). For what values of d will the linear system have an **infinite** number of solutions?

c. (5 points). For what values of d will the linear system have a **zero** number of solutions?

d. (5 points). For what values of d will the linear system have a **single** solution?
